

Yes, for these specific "mixing reality with AI" shots, **Runway Gen-3 Alpha** and **Kling AI** will vastly outperform Google Flow in both resolution (1080p/4K) and creative control.

Because you are mixing **real footage** (the table, the river, the grass) with **AI elements**, you cannot just "prompt and pray." You need tools that allow **Inpainting** (editing just part of the video) or **Green Screen** generation.

Here is the best tool for each of your five scenes:

1. Banksy Alice on a Real Table & 5. Rabbit on Real Grass

Best Tool: Runway Gen-3 Alpha (Inpainting)

- **Why:** Runway allows you to upload your real video (of the empty table or grass), use a "Motion Brush" to paint over just the area where you want the character, and prompt "2D Banksy style Alice standing up."
- **The Upgrade:** Unlike Google Flow, which often hallucinates the whole scene, Runway preserves your *actual* camera footage of the table/grass and only generates the cartoon character on top of it.
- **Alternative Pro Workflow:** Generate the character on a "Green Background" in Runway, download it, and key it out in your editing software (Premiere/DaVinci) for perfect placement.

2. Nurse Materializing in a Hospital Ward

Best Tool: Runway Gen-3 (Video-to-Video)

- **Why:** You can film an actor (or a stand-in) walking into the frame. Upload that clip to Runway and use "Video-to-Video" with a prompt like "Ghostly translucent nurse."
- **The Upgrade:** You can control the "Denoising Strength." Set it low to keep the nurse looking exactly like your actor, or high to make her look more supernatural. You can then dissolve this AI clip over your empty background plate in your editor to make her "materialize."

3. Water Geyser Speaking on the River Wey

Best Tool: Kling AI (Lip Sync)

- **Why:** Kling has a specific, powerful "**Lip Sync**" feature that works on non-human objects.
- **The Workflow:**
 1. Upload a still photo or short clip of the River Wey.
 2. Use Kling to animate a "water face" or geyser rising.
 3. Select that generated clip and hit "**Lip Sync**."
 4. Upload your voice file (or type text). Kling will warp the water to form a mouth that matches the dialogue. Google Flow cannot do this with any accuracy.

4. Rotating Motorway Pillar (Turning into a Door)

Best Tool: Luma Dream Machine (Keyframes) or Runway

- **Why:** This is a geometry problem. Luma is excellent at "consistency."
- **The Workflow:**
 - Take a photo of the real pillar.
 - Take a second photo (edited in Photoshop) where the pillar has a door.
 - Upload both to Luma as "**Start Frame**" and "**End Frame**."
 - Luma will generate the smooth video transition (the rotation and morph) between them.

Summary of "Better"

Scene	Recommended Tool	Specific Feature to Use
-------	------------------	-------------------------

Alice (Banksy)	Runway	Inpainting (Paint over table)
Nurse	Runway	Video-to-Video (Style transfer on actor)
Speaking Geyser	Kling AI	Lip Sync (Animate face on water)
Pillar Door	Luma	Keyframes (Start/End Image)
Rabbit on Grass	Runway	Green Screen (Generate rabbit -> Overlay)

Pro Tip for your Movie:

Don't try to generate the *entire* shot in AI.

1. **Film your background plates** (the real River Wey, the real grass) with your camera.
2. **Generate only the element** (the rabbit, the geyser) using the tools above.
3. **Composite them** in your editing software.
This ensures your movie looks "real" (because 80% of it is) and avoids that "wobbly AI nightmare" look that Google Flow gives you.

More detailed discussion on the pillar scene:

Although I cannot watch your specific YouTube video directly through this chat link, I know exactly what a "Google Flow / Veo" video looks like right now. [1]

If your shot features a real-world camera image of a motorway pillar that you are prompting to rotate, open a door, or morph, **Luma Dream Machine** and **Kling AI** can do the exact same "pot luck" lottery workflow, but the visual result will be vastly superior. [1]

Here is how their "pot luck" approach will give you a better result than Google Flow:

1. No More "Wobbly" AI Physics

Google Flow's current underlying engine (Veo) is great for short, artistic clips, but it tends to treat objects like jelly. If you ask it to rotate a concrete pillar, the concrete often stretches, warps, or loses its straight lines. [1, 2]

- **The Better Way:** If you upload your pillar shot into **Luma Dream Machine**, its physics engine treats structures like solid objects. When it rotates or changes, it maintains hard, straight, architectural edges. [1, 2]

2. Hollywood-Grade Lighting and Texture

A core flaw of Google Flow is that morphed objects often look flat or clearly "drawn on."

- **The Better Way:** If you tell **Luma** or **Kling** to turn that pillar into the *2001: A Space Odyssey* black Monolith block, they will render the block with realistic, glossy reflections. As the block appears, it will accurately reflect the real sky, trees, and motorway lighting from your original photo. It looks like a high-end VFX asset, not an AI glitch. [1]

3. Crisp Resolution (No Blur or Compressed Pixels)

Google Flow frequently outputs lower resolution drafts that look heavily compressed or blurry around the edges. [1]

- **The Better Way:** Both **Kling** and **Luma** output in razor-sharp **1080p HD** (and up to **4K** on higher tiers). The concrete texture of the pillar and the dark void of the open door will be clean, sharp, and easy to watch on a big screen. [1, 2]

How to play the "Pot Luck" lottery on them:

You don't have to change your habits at all to get this quality upgrade.

1. Go to [Luma Dream Machine](#) or [Kling AI](#) [INDEX: 1.1.11].

2. Upload your motorway pillar picture as the "Image input."
3. Type your direct command: *"The concrete pillar cleanly rotates open like a heavy stone door, morphing into a completely smooth, glossy black alien Monolith block from 2001: A Space Odyssey. Ultra-realistic, cinematic lighting."*
4. Pull the **"Creativity" slider up** (available on Kling) to tell the AI to take wild creative risks with your image.
5. Hit generate 5 or 6 times. [\[1\]](#)

Because both platforms offer **free daily testing credits**, you can roll the dice on your pillar shot right now without paying a penny to see the quality jump for yourself. [\[1\]](#), [\[2\]](#)

Which platform would you like to try rolling the dice on first, and I can give you a couple of alternative prompts to test?
